The invention relates to an isolated specific binding member (I) which recognizes an epidermal growth factor receptor (EGFR) epitope which is recognizes an epidermal growth factor receptor (EGFR) epitope which is found in tumourigenic, hyperpoliferative or abnormal cells and not detectable in normal cells. The EGFR epitope is located within the region acid sequence alterations or substitutions. From normal EGFR. (I) is capable of binding the de-7 EGFR at an epitope distinct from the innormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprises the VH and VL cormal wild-type gene. The binding member comprised with the presence of amplified EGFR, de2-7EGFR or EGFR with high mannose glycosylation is suspected with (I) under conditions that allow binding the presence of amplified EGFR, from the sample and the antibody, where the corner between the EGFR from the sample and the antibody, where the corner the EGFR to the artibody to occur, and detecting cancer in mammals by detecting the presence or activity of an EGFR with indicates the existence of a tumour or cancer in the mammal. A pharmaceutical comprising and/or treating cancer in mammals, sepecially for treating brain-resident cancers that produce aberrantly expressed EGFR in mammals, sepecially expressed EGFR in mammals, under sequence represents the mammals. And malignant maniglomar, and malignant cancer in mammals. The present sequence represents the mammals and malignant cancer in mammals. The member of mammals and malignant cancer in mammals. The member of mammals and the analyses and malignant cancer in mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GNKLEMMGYISYSGNTRYNPSLKSRISITRDTSKNOFFLQLNSVTIEDTATYYC---VTA 117

                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR28670-71 were encoded by plasmids which were used in example to illustrate the production of a human antibody which recognises human interleukin-6 receptor (IL-6R). The antibody comprises light (L) chain and heavy (H) chain variable regions which were derived from a monoclonal antibody produced from the hybridoma PM1 which contained the plasmids pPM-k3 and pPM-h1. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MRVLILLWLFTAFPGILSDVQLQESGPVLVKPSQSLSLTCTVTGYSITSDHAWSWIRQFP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infarction, acute kidney failure, chronic rheumatism, carebral infarction, acute kidney failure, chronic rheumatism, cardiac shock, pancreatitis, adult respiratory distress syndrome and collifis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2. Spleen cells from the mice were fused with mouse myetlome B3U1 (Pax6Apg U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12H5, 1.4 and 10.1. These were cultured and the antibody isolated from the culture supernatant by precipitation with ammonium sulphate and purification on a column of protein A-Sepharose CL4B. Because the antibody acts on the primate and mouse forms of enzyme as well as human it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monoclonal antibody 1.4 heavy chain against type II phospholipase A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monoclonal antibody inhibiting type II phospholipase A2 activity for treatment of myocardial and cerebral infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monoclonal antibodies which inhibit type II phospholipase A2 are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the heavy chain variable region of 5B3 antibody. The CDNA encoding this sequence was obtained from total RNA extracted from a SB3 hybridoma by RT-PCR. 5B3 is an igg1 antibody derived from a TNP-KLH immunised mouse. Its binding to TNP or DNS antigen can be blocked by very low amounts of TNT and it can therefore be used in a method for detecting small assayed explosive molecules. Molecules are detected using a piezoelectric immunoassaying in liquid phase allows stationary and flow analysis of an aqueous sample. The method is sufficiently sensitive for detection of low molecular weight molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 GNKLEWMGYISYSGITTYNPSLKSRISITRDTSKNQFFLQLNSVTTGDTSTYYCARSLAR 120

The present invention. The present invention of the present invention of the present invention of Kidney disorders (such as a cute renal failure) associated with the administration of cisplatin for the treatment of cancer. The method comprises treatment with a monoclonal antibody which inhibits the comprises treatment with a monoclonal antibody witch inhibits the phospholipase A2 of human origin), or with a protein or peptide possessing the same inhibitory activity and containing a part of the possesing the same inhibitory activity and containing a part of the apendor mouse type II phospholipase A2, and has the ability to release type II phospholipase A2, and has the ability to release type II phospholipase A2 bound to a cell membrane. Three specific monoclonal antibodies having these properties which can be used are 12H5, 10.1 and 1.4, derived from hybridomas FERM BP-5300, FERM BP-529 and FERM BP-529 respectively. The method can be used for cisplatin administration, and therefore allowing more efficient use of this drug as an anticancer agent, e.g. by allowing an increased dosage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAR29012-15 are portions of monoclonal antobodies which were encoded by plasmids derived from mouse hybridomas. The DNA encoding complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (IL-6R). The mouse hybridoma cells were transformed with the plasmids encoding these genes which caused the secretion of these antibodies from the hybridoma cells. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                              This sequence represents a single chain FV (ScFV) sequence. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; ScFv.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         with low or no antigenic binding activity, for diagnosis, study of, and production of drugs treating abnormal functions of the protein

The DNA encoding complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (IL-6R). The mouse hybridoma cells were secretion of these antibodies from the hybridoma cells were (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TWT) method wherein an epitope recognised by an antibody is carried in a fused

                                                                                                                                 124
                                                                                                                                                        This sequence represents a single chain FV (ScFV) sequence. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective,

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the CDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused

                                                                                                        g
                                                                                                                                                                      This sequence represents a single chain Fv (ScFv) sequence.

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a cDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, the protein is such a technique is efficient and selective.

The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a CDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the prior-art transmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the heavy chain variable region for monoclonal antibody (MAb) 13D10, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridoma cells. The protein can be used for binding heavy metals such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of

Patent No. US2002015514A1

GENERAL INFORMATION:
APPLICANT: Marks, James D.

APPLICANT: Amersdorfer, Peter
TITLE OF INVENTION: Therapeutic Monoclonal Antibodies That Neutralize
TITLE OF INVENTION: Betulinum Neurotoxins
FILE REFERENCE: 2500.1170NS
CURRENT APPLICATION NUMBER: US/09/144,886
CURRENT FILING DATE: 1998-08-31
NUMBER OF SEQ ID NOS: 98

SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 58

LENGTH: 115
